## DETAILED ACTION

### *Election/Restrictions*

Applicant's election without traverse of claims 1-13 in the reply filed on 7-2-04 is acknowledged.

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-3, 5-7, 9, 10, 12 and 13 are rejected under 35 U.S.C. 102(b) as being anticipated by Davis et al (5,668,397). The reference teaches the inventive concept and structure of a semiconductor device having two dopants, where one dopant has a covalent bond radius larger than the radius of the semiconductor constituent atom, while the other dopant has a covalent bond radius which is smaller than the radius of the semiconductor constituent atom. For example, Davis states at col. 2, l. 28-31 that after adding dopant species that ... "have an atomic radius smaller than that of silicon, impurity atoms having a larger atomic radius may be added to reduce stress within the active lattice structure." Davis goes on to discuss the well known atomic radii of various common semiconductor dopants used in the art.

Having taught the inventive concept, and since the physical properties of all atomic elements are common knowledge, the use of well known dopants such as indium, boron and carbon, as claimed by applicants, to balance and offset the lattice stresses created, would be inherent in the teaching of Davis.

***Allowable Subject Matter***

Claims 4, 8, and 11 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
